

PLUGINS	DESCRIPTION
<b>**</b>	<b>IDENTIFY ROGUE PROCESSES</b>
<b>pslist</b>	Print all running processes within the EPROCESS doubly linked list
<b>psscan</b>	Scan physical memory for EPROCESS pool allocations
<b>pstree</b>	Print process list as tree showing parent relationships (using EPROCESS linked list)
<b>pstotal</b>	Comparison of <b>psscan</b> and <b>pslist</b> results. Also, produces output in graphics format
<b>malprocfind</b>	Automatically identify suspicious system processes
<b>processbl</b>	Compare processes and loaded DLLs with a baseline image
<b>**</b>	<b>ANALYZE PROCESS DLLS AND HANDLES</b>
<b>dlllist</b>	Print list of loaded dlls for each process
<b>cmdline</b>	Display command-line args for each process
<b>getsids</b>	Print ownership of SIDs for each process
<b>handles</b>	Print list of open handles for each process
<b>mutantscan</b>	Scan memory for mutant objects (kMUTANT)
<b>**</b>	<b>REVIEW NETWORK ARTIFACTS</b>
<b>netscan</b>	All the above - scan both connections and sockets [Vista+]
<b>**</b>	<b>LOOK FOR EVIDENCE OF CODE INJECTION</b>
<b>malfind</b>	Find hidden and injected code and dump affected memory sections
<b>ldrmodules</b>	Detect unlinked DLLs and image binaries
<b>hollowfind</b>	Attempts to identify evidence of process hollowing
<b>**</b>	<b>CHECK FOR SIGNS OF HOOKING AND ROOTKIT</b>
<b>ssdt</b>	Display System Service Descriptor Table entries ( <i>egrep -v '(ntoskrnl win32k)'</i> )
<b>psxview</b>	Find hidden processes via cross-view techniques
<b>modscan</b>	Scan memory image to find loaded, unloaded, and unlinked kernel modules
<b>modules</b>	Walk linked list to identify kernel drivers loaded
<b>apihooks</b>	Find DLL function (Inline and Trampoline) hooks. Mainly for Address table and inline API
<b>driverirp</b>	Identify I/O request Packets (IRP) hooks
<b>idt</b>	Identify Interrupt Descriptor Table hooks
<b>**</b>	<b>DUMP SUSPICIOUS PROCESSES, DRIVERS, DLLS, FILES</b>
<b>dlldump</b>	Dump DLLs from a process
<b>moddump</b>	Dump a kernel driver to an executable file sample
<b>procdump</b>	Dump a process to an executable file sample
<b>memdump</b>	Dump all addressable memory for a process into one file
<b>cmdscan</b>	Scan for COMMAND_HISTORY buffers (if not found, run strings against process)
<b>consoles</b>	Scan for CONSOLE_INFORMATION output
<b>dumpfiles</b>	Extract files by name or physical offset
<b>filescan</b>	Scan memory for FILE_OBJECTs (Files opened, potentially encrypted, we can dump it)
